Big list of issues in the portability of polygenic scores across groups

- 1) Population stratification: GWAS effect sizes can be biased absorb the effects of covarying environmental and genetic gradients.

Reduced signal for polygenic adaptation of height in UK Biobank

Big list of issues in the portability of polygenic scores across groups

- 1) Population stratification: GWAS effect sizes can be biased absorb the effects of covarying environmental and genetic gradients.
- 2) We are missing a large number of variants and the genetic architecture will differ somewhat among populations, e.g. due to drift.
- 3) Effect sizes of the loci we have may not transfer over groups
 - We assume no dominance or epistasis.
 - Not causal alleles, but rather alleles that are in linkage disequilibrium (LD) with them
 - Gene by environment interactions
 - Differences in assortative mating and indirect effects
- 4) Groups of people experience different distributions of environments so can differ in their phenotypic mean

The Apportionment of Human Diversity

Modern version (expressed in terms of F_{ST})

Little variance in genotypes is attributable to differences among human “ancestries” (e.g. continent-level populations)

Most common genetic diversity is present at the level of individual human ‘populations’

Little loss in heterozygosity in sub-populations compared to world wide populations

So can allele frequency changes contribute much to lack of portability?

SCIENCE

The Heritability Hang-up

The role of variance analysis in human genetics
is discussed.

M. W. Feldman and R. C. Lewontin

The nature-nurture issue has provided some of the most keenly contested debates in the fields of biology, psychology, sociology, and physics during the past 5 years.

Other quantitative traits in humans, are all based on a fundamental methodology that was invented by R. A. Fisher, the analysis of variance. The analysis of variance is

turbation analysis. It is assumed that the actual IQ of an individual is some unknown function of genotype (G) and environment (E)

$$IQ = f(G, E)$$

In any given population, there is some joint distribution of genotypes and environments

$$\phi(G, E)$$

and this joint distribution is mapped onto a distribution of IQ scores $\alpha(IQ)$ by a functional equation.

A complete analysis of the causes of variation would involve predicting the changes in the IQ distribution $\alpha(IQ)$ from changes in the distribution of genotypes and environments $\phi(G, E)$. However, such an analysis would require that we know the first partial derivatives of the unknown function $f(G, E)$. What we substitute in-

Population differences in mean additive genetic values and mean polygenic scores

The Apportionment of Human Diversity

Additive genetic value of an individual

$$Z = \alpha_1 g_1 + \alpha_2 g_2 + \dots + \alpha_L g_L$$

Mean additive genetic value of population

$$\bar{Z} = 2\alpha_1 p_1 + 2\alpha_2 p_2 + \dots + 2\alpha_L p_L$$

R. C. LEWONTIN

1972

*Committee on Evolutionary Biology,
University of Chicago,
Chicago, Illinois*

Estimated effect sizes: $\alpha_1, \alpha_2, \alpha_3 \dots$

Genotypes $g_1, g_2, g_3 \dots$

Population freq. $p_1, p_2, p_3 \dots$

For a neutrally evolving phenotype

$$\mathbb{E} [(\bar{Z}_A - \bar{Z}_B)^2]$$

Population differences in mean additive genetic values and mean polygenic scores

The Apportionment of Human Diversity

Additive genetic value of an individual

$$Z = \alpha_1 g_1 + \alpha_2 g_2 + \dots + \alpha_L g_L$$

R. C. LEWONTIN 1972

*Committee on Evolutionary Biology,
University of Chicago,
Chicago, Illinois*

Mean additive genetic value of population

$$\bar{Z} = 2\alpha_1 p_1 + 2\alpha_2 p_2 + \dots + 2\alpha_L p_L$$

Estimated effect sizes: $\alpha_1, \alpha_2, \alpha_3 \dots$

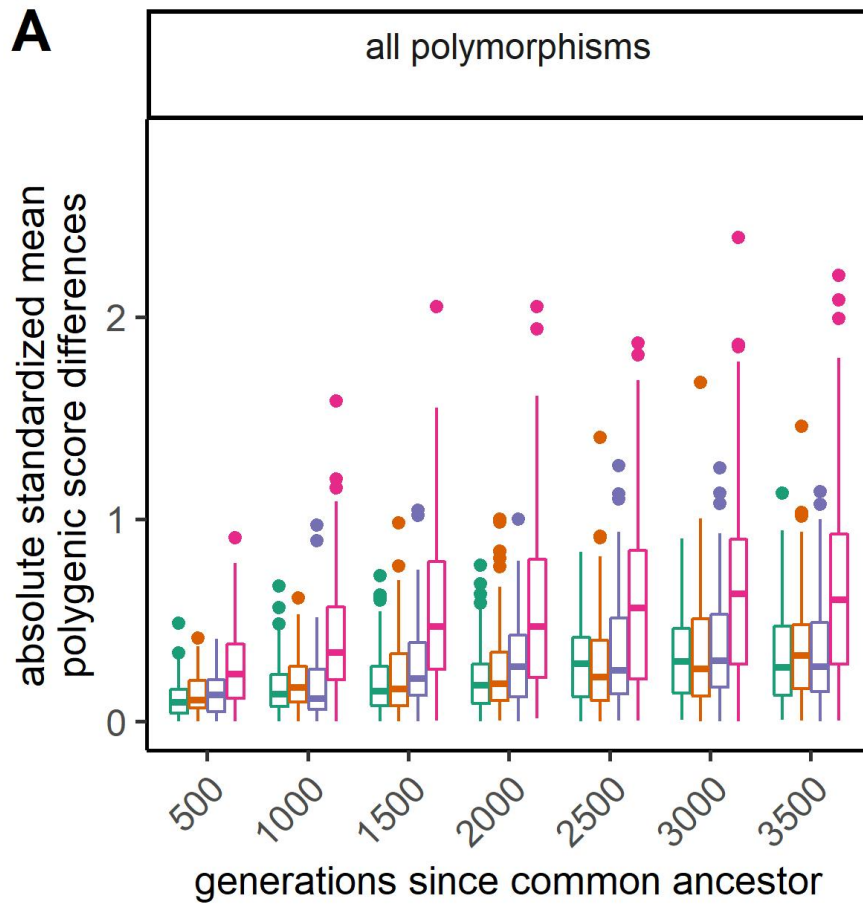

Genotypes $g_1, g_2, g_3 \dots$

Population freq. $p_1, p_2, p_3 \dots$

For a neutrally evolving phenotype $\mathbb{E} [(\bar{Z}_A - \bar{Z}_B)^2] = 4V_a F_{ST}$

Stabilizing selection is expected to reduce this.

We'll study this using absolute standardized difference $\frac{|\bar{Z}_A - \bar{Z}_B|}{2\sqrt{V_a F_{ST}}}$

A
